

ABSTRACT OF THE DISCLOSURE

A telecommunication terminal is provided which includes a recording device for recording acoustic user information, a memory for storing acoustic effect data, and a mixing device which is embodied in such a way that, in a mixing mode of operation, the acoustic user information recorded by the recording device is modified using the acoustic effect data stored in the memory. The telecommunication terminal also includes a control device which is connected to the mixing device and automatically ends the mixing mode after a pre-determined operating mode.
